

Low Fidelity Prototype of Shopping Cart

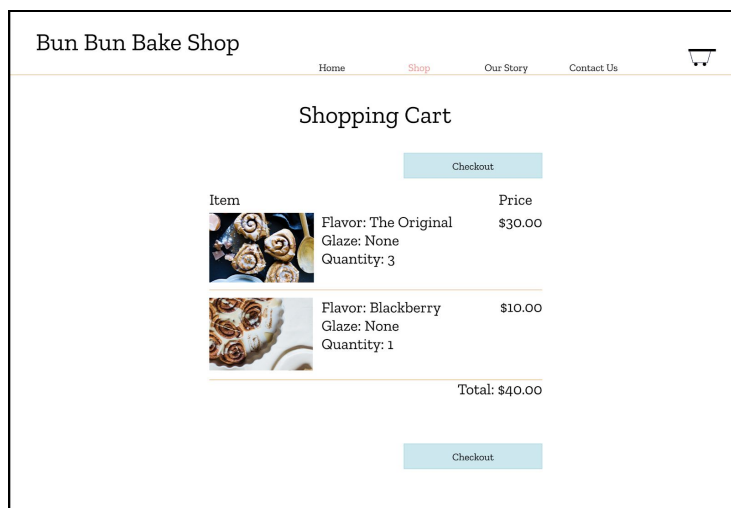

Design choice explanation:

I displayed the product details on the shopping cart page to address the heuristic, recognition rather than recall. The user can see exactly what they have selected from the previous page so that they do not need to remember it. Additionally, I aligned the prices and total price to the right side. By separating the price into its own row, the user can quickly scan to see what they are paying for.

High Fidelity Prototype of Shopping Cart

Design choice explanation:

I chose to put the checkout on the top and bottom of the page. If there are a lot of items added to the cart, the user does not have to scroll to the bottom of the page to find the checkout button. The intention behind this design choice is to facilitate a quick checkout process.

Additionally, I maintained the same button style from the product details page for consistency.
